

## The Process of Growth

- Metabolism required for growth, both anabolic and catabolic. ~2000 reactions!
- Usual Definition: **Increase in cell numbers**  
Other definitions possible - spores, UMC's, respiration, viable but nonculturable, morphology changes (life cycle)
- Divide via Binary Fission: 3 mechanisms involved!  
Cell Elongation - cell wall  
DNA Replication - rate limiting step  
Cell Division - septum formation

### The Process of Growth

- Growth Rate: Time it takes to reproduce  
 $t_{\frac{1}{2}} = \ln 2 / \mu = 0.693 / \mu = g$
- Phases of Growth in Batch culture  
 Lag, Log, Stationary, Death
- Measurement of Growth  
 Total cell counts  
 Viable cell counts  
 Turbidity

---

---

---

---

---

---

---

---

### The growth rate of a microbial culture

Time (h)	Total number of cells	Time (h)	Total number of cells
0	1	4	256 ( $2^8$ )
0.5	2	4.5	512 ( $2^9$ )
1	4	5	1,024 ( $2^{10}$ )
1.5	8	5.5	2,048 ( $2^{11}$ )
2	16	6	4,096 ( $2^{12}$ )
2.5	32	.	.
3	64	.	.
3.5	128	10	1,048,576 ( $2^{19}$ )

---

---

---

---

---

How to estimate the generation times of an exponential microbial culture using semi-log plots.

$t$  = time  
 $n$  = generations  
 $g$  = generation time

---

---

---

---

---

---

---

---

---

---

**Table 6.1** Approximate generation times for several organisms growing in media optimal for growth

Species	Generation Time
<i>Escherichia coli</i>	20 min
<i>Bacillus subtilis</i>	28 min
<i>Staphylococcus aureus</i>	30 min
<i>Pseudomonas aeruginosa</i>	35 min
<i>Thermus aquaticus</i>	50 min
<i>Thermoproteus tenax</i>	1 hr 40 min
<i>Rhodobacter sphaeroides</i>	2 hr 20 min
<i>Sulfolobus acidocaldarius</i>	4 hr
<i>Thermocophilum album</i>	6 hr
<i>Thermophilum pendens</i>	10 hr
<i>Mycobacterium tuberculosis</i>	13 hr 20 min
